

Alternative vent made from
304 or 316 stainless steel

The chimney void could be made from 304 stainless steel, around 1mm thick, (easily welded) to flow the smoke and gasses in as a direct line as possible under the constraints of your build. I would make the flue at least 8" as a 6" would not handle the amount of smoke until it got hot to draw as you hope. It would be very easy to dynabolt onto bricks both over your oven doorway and also the back of your face arch.
